

Unit 4, Lesson 07: Half-life, Answers to Homework

Page 287: Q 9 – 12

9. For a first order reaction: $t_{1/2} = \frac{0.693}{k}$ and $k = \frac{0.693}{t_{1/2}}$

a) $t_{1/2} = \frac{0.693}{k}$
 $= \frac{0.693}{9.2 \text{ s}^{-1}}$
 $= 0.075 \text{ s}$

b) After 1 half life, 50 % of the cyclopropane will remain

- after 2 half lives, $\frac{1}{2} \times 50\%$ or 25% will remain
- after 3 half-lives, $\frac{1}{2} \times 25\%$ or 12.5% will remain
- after 4 half-lives, $\frac{1}{2} \times 12.5\%$ or 6.25% will remain

10a) $k = \frac{0.693}{t_{1/2}}$
 $= \frac{0.693}{32 \text{ min}}$
 $= 0.022 \text{ min}^{-1}$
 or 0.00036 s^{-1}

c) 128 minutes represents 4 half-lives, so after 4 half-lives there are 3.1×10^{13} molecules /L

- at 3 half-lives, there would have been $2 \times (3.1 \times 10^{13} \text{ molecules /L})$
- at 2 half-lives there would have been $4 \times (3.1 \times 10^{13} \text{ molecules /L})$
- at 1 half-life there would have been $8 \times (3.1 \times 10^{13} \text{ molecules /L})$
- at time zero, there would have been $16 \times (3.1 \times 10^{13} \text{ molecules /L})$ or 5.0×10^{14} molecules /L

11. After 10 half- lives, a reaction is essentially over. This is shown:

- after 1 half life, 50 % of the reactants will remain
- after 2 half lives, $\frac{1}{2} \times 50\%$ or 25% will remain
- after 3 half-lives, $\frac{1}{2} \times 25\%$ or 12.5% will remain
- after 4 half-lives, $\frac{1}{2} \times 12.5\%$ or 6.25% will remain
- after 5 half-lives, $\frac{1}{2} \times 6.25\%$ or 3.125% will remain
- after 6 half-lives, $\frac{1}{2} \times 3.125\%$ or 1.56% will remain
- after 7 half-lives, $\frac{1}{2} \times 1.56\%$ or 0.78% will remain
- after 8 half-lives, $\frac{1}{2} \times 0.78\%$ or 0.39% will remain
- after 9 half-lives, $\frac{1}{2} \times 0.39\%$ or 0.195% will remain
- after 10 half-lives, $\frac{1}{2} \times 0.195\%$ or 0.10% will remain

Because the reactant is essentially consumed by the end of the third half life, very little further reaction can occur.

12. Referring to the half-life calculations above, there is about 10% of the sample left after three half-lives. If the half-life for a reaction is 120 s, then three half-lives is 360 s. It will take slightly longer to consume an additional 2.5%, so it will take about 400 s until only 10% of the original reactant is left.

Page 288, Q 7

7. $t_{1/2} = \frac{0.693}{k}$
 $= \frac{0.693}{0.0234 \text{ a}^{-1}}$
 $= 29.6 \text{ a}$ (“a” for annum or years)

Convert to seconds:

$$29.6 \text{ year} \times 365 \text{ days/year} \times 24 \text{ h/day} \times 3600 \text{ s/h}$$

$$= 9.34 \times 10^8 \text{ s}$$
