## Answers to Review \#4: Thermochemistry

1. Know the meanings of, and be able to apply, the following terms:
enthalpy endothermic reaction exothermic reaction
thermochemical equation calorimetry specific heat capacity
standard enthalpy (heat) of formation standard state
Hess's Law
2. A hot piece of metal is placed in 30.0 mL of water in a coffee cup calorimeter. As the metal cools, the water warms from $20.0^{\circ} \mathrm{C}$ to $24.0^{\circ} \mathrm{C}$. How much heat does the water absorb? ( 0.502 kJ )
3. What are the standard states of the following elements (give both the chemical formula and state)? sulfur: $\underline{S(s)} \quad$ carbon: $\underline{C(s)}$ as graphite hydrogen: $\underline{H}_{2}$ (g) iodine: $\underline{I}_{2}(s)$ neon: $\underline{\mathrm{Ne}(\mathrm{g})}$

4. Write formation equations for the following substances:
a) $\mathrm{Na}(\mathrm{s})+\frac{1}{2} \mathrm{~N}_{2}(\mathrm{~g})+3 / 2 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{NaNO}_{3}(\mathrm{~s})$
b) $\mathrm{N}_{2}(\mathrm{~g})+4 \mathrm{H}_{2}(\mathrm{~g})+\mathrm{C}(\mathrm{s})+3 / 2 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow\left(\mathrm{NH}_{4}\right)_{2} \mathrm{CO}_{3}(\mathrm{~s})$
c) $2 \mathrm{Hg}(\mathrm{I})+\mathrm{S}(\mathrm{s})+3 / 2 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{Hg}_{2} \mathrm{SO}_{3}(\mathrm{~s})$
d) $\mathrm{C}(\mathrm{s})+\mathrm{H}_{2}(\mathrm{~g})+\frac{1}{2} \mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{CH}_{2} \mathrm{O}(\mathrm{I})$
5. Use standard enthalpies of formation $\left(\Delta H^{\circ} f\right)$ to calculate the heat of reaction $(\Delta H)$ for the following:
a) $\mathrm{C}_{2} \mathrm{H}_{4}(\mathrm{~g})+2 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{CO}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{g})$
$\Delta H=-1323 \mathrm{~kJ}$
b) $\mathrm{N}_{2} \mathrm{H}_{4}(\mathrm{I})+2 \mathrm{H}_{2} \mathrm{O}_{2}(\mathrm{I}) \rightarrow \mathrm{N}_{2}(\mathrm{~g})+4 \mathrm{H}_{2} \mathrm{O}$ (g)
$\Delta H=-642.2 \mathrm{~kJ}$
c) $\mathrm{NH}_{3}(\mathrm{~g})+\mathrm{HCl}(\mathrm{g}) \rightarrow \mathrm{NH}_{4} \mathrm{Cl}(\mathrm{s})$
$\Delta H=-176.2 \mathrm{~kJ}$
6. Use Hess's Law to calculate the heat of reaction $(\Delta H)$ for the reaction:
(-648 kJ)

$$
\mathrm{N}_{2} \mathrm{H}_{4}(\mathrm{I})+2 \mathrm{H}_{2} \mathrm{O}_{2}(\mathrm{I}) \rightarrow \mathrm{N}_{2}(\mathrm{~g})+4 \mathrm{H}_{2} \mathrm{O}(\mathrm{~g})
$$

Given:

$$
\begin{array}{ll}
\mathrm{N}_{2} \mathrm{H}_{4}(\mathrm{I})+3 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{NO}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{~g}) & \Delta \mathrm{H}=-466 \mathrm{~kJ} \\
\mathrm{H}_{2} \mathrm{O}(\mathrm{I})+\frac{1}{2} \mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{H}_{2} \mathrm{O}_{2}(\mathrm{I}) & \Delta \mathrm{H}=+98 \mathrm{~kJ} \\
\frac{1}{2} \mathrm{~N}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{NO}_{2}(\mathrm{~g}) & \Delta \mathrm{H}=+34 \mathrm{~kJ} \\
\mathrm{H}_{2} \mathrm{O}(\mathrm{I}) \rightarrow \mathrm{H}_{2} \mathrm{O}(\mathrm{~g}) & \Delta \mathrm{H}=+41 \mathrm{~kJ}
\end{array}
$$

7. A 1.00 gram sample of the rocket fuel hydrazine, $\mathrm{N}_{2} \mathrm{H}_{4}$, is burned in a calorimeter containing 1200.0 g of water. The temperature of the water rises from 24.62 to $28.16^{\circ} \mathrm{C}$. The reaction is:

$$
\begin{equation*}
\mathrm{N}_{2} \mathrm{H}_{4}(\mathrm{I})+3 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{NO}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{~g}) \tag{17.8kJ}
\end{equation*}
$$

a) Calculate the amount of heat $(Q)$ absorbed by the water when 1.000 g of hydrazine burns.
b) Calculate the heat of reaction $(\Delta H)$ per mole of hydrazine burned.
(-570. kJ/mol $\mathrm{N}_{2} \mathrm{H}_{4}$ )
8. For the reaction: $\quad \mathrm{Fe}_{2} \mathrm{O}_{3(\mathrm{~s})}+3 \mathrm{CO}_{(\mathrm{g})} \rightarrow 2 \mathrm{Fe}_{(\mathrm{s})}+3 \mathrm{CO}_{2(\mathrm{~g})} \quad \Delta H^{0}=-25.0 \mathrm{~kJ}$

Calculate the amount of energy required/released when 100.0 grams of pure iron are formed. ( -22.4 kJ ) Use stoichiometry. When 2 mol of $\mathrm{Fe}(\mathrm{s})$ are produced, -25.0 kJ of heat are released. Convert 100.0 g of pure Fe to moles, then find how much heat this will produce using the mole ratio.
9. Given:

$$
\begin{array}{ll}
\mathrm{MnO}_{2}(\mathrm{~s}) \rightarrow \mathrm{MnO}(\mathrm{~s})+\frac{1}{2} \mathrm{O}_{2}(\mathrm{~g}) & \Delta \mathrm{H}=+134.8 \mathrm{~kJ} \\
\mathrm{MnO}_{2}(\mathrm{~s})+\mathrm{Mn}(\mathrm{~s}) \rightarrow 2 \mathrm{MnO}(\mathrm{~s}) & \Delta \mathrm{H}=-250.1 \mathrm{~kJ}
\end{array}
$$

Calculate the heat of formation of $\mathrm{MnO}_{2}(s) . \quad(-519.7 \mathrm{kJI})$
The formation reaction for $\mathrm{MnO}_{2}(s)$ is: $\mathrm{Mn}(\mathrm{s})+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{MnO}_{2}(\mathrm{~s})$. This is the target reaction that we want to find $\Delta H$ for. Use Hess's Law and the two equations you are given to find $\Delta H$ for this target reaction.
10. When one mole of $\mathrm{CH}_{4}(\mathrm{~g})$ burns in a bomb calorimeter containing 21.00 kg of water, the temperature of the water rises by $9.140^{\circ} \mathrm{C}$. (Use $\mathrm{c}=4.184 \mathrm{~J} / 9^{\circ} \mathrm{C}$ so answer will have 4 sig digs)
a) Write the balanced reaction for the complete combustion of methane.
b) Use heats of formation to calculate the $\Delta H$ for the combustion per mole of methane $(-802.5 \mathrm{~kJ} / \mathrm{mol})$
c) Use the calorimetry data above to calculate the heat of combustion $(\Delta \mathrm{H})$ per mole of $\mathrm{CH}_{4} \quad(-803.1 \mathrm{~kJ})$
11. If a reaction is endothermic, which is higher, the enthalpy of the reactants or of the products?

- endothermic reactions absorb energy. The energy is stored as chemical potential energy so the enthalpy of the products is higher.

12. In an experiment, 3.116 g of solid lithium hydroxide is mixed with 200.0 mL of 0.750 M solution of nitric acid in a coffee cup calorimeter. A neutralization (double displacement) reaction occurs and the temperature of the nitric acid goes from $24.5^{\circ} \mathrm{C}$ to $31.4^{\circ} \mathrm{C}$.
a) Write the balanced chemical reaction for the reaction that occurs. Include the states of all reactants and products.
$\mathrm{LiOH}(\mathrm{s})+\mathrm{HNO}_{3}(\mathrm{aq}) \rightarrow \mathrm{H}_{2} \mathrm{O}(\mathrm{I})+\mathrm{LiNO}_{3}(\mathrm{aq})$
b) Calculate the molar enthalpy of reaction $(\Delta H)$ per mole of lithium hydroxide. $(-44.4 \mathrm{~kJ} / \mathrm{mol} \mathrm{LiOH})$
c) State three assumptions that should not significantly affect the accuracy of the results.

- assume that the density of dilute nitric acid is the same as the density of pure water
- assume that the specific heat capacity of dilute nitric acid is the same as the specific heat capacity of pure water
- assume that the calorimeter is a perfect insulator and no heat is lost to the surroundings
- assume that no energy is transferred to the solution by stirring
- assume that all of the chemical potential energy is converted perfectly to thermal kinetic energy

13. Consider the following equations:

$$
\begin{array}{ll}
\text { (1) } \mathrm{Fe}_{2} \mathrm{O}_{3(s)}+3 \mathrm{CO}_{(g)} \rightarrow 2 \mathrm{Fe}_{(s)}+3 \mathrm{CO}_{2(g)} & \Delta H^{\circ}=-25 \mathrm{~kJ}  \tag{1}\\
\text { (2) } 3 \mathrm{Fe}_{2} \mathrm{O}_{3(s)}+C \mathrm{CO}_{(g)} \rightarrow 2 \mathrm{Fe}_{3} \mathrm{O}_{4(s)}+\mathrm{CO}_{2(g)} & \Delta H^{\circ}=-47 \mathrm{~kJ} \\
\text { (3) } \mathrm{Fe}_{3} \mathrm{O}_{4(\mathrm{~s})}+\mathrm{CO}_{(g)} \rightarrow 3 \mathrm{FeO}_{(\mathrm{s})}+\mathrm{CO}_{2(g)} & \Delta H^{\circ}=+38 \mathrm{~kJ}
\end{array}
$$

(3)

Calculate $\Delta H$ for the reaction:

$$
\begin{equation*}
\mathrm{FeO}_{(\mathrm{s})}+\mathrm{CO}_{(\mathrm{g})} \rightarrow \mathrm{Fe}_{(\mathrm{s})}+\mathrm{CO}_{2(\mathrm{~g})} \tag{-17~kJ}
\end{equation*}
$$

Hint: Do not use fractional mole ratios. Your final equation will end up with molar coefficients of 6 . Simplify the reaction by dividing through by 6 and also divide your $\Delta H$ by 6 to give -17 kJ .
