## Answers to Review \#6: Equilibrium Theory

1. Know the meanings of, and be able to apply, the following terms:

| enthalpy | Gibb's Free energy | equilibrium |
| :--- | :--- | :--- |
| entropy | spontaneous reaction |  |

2. What are four conditions that must be met in order for equilibrium to be established?

- the reaction must be reversible
- the system must be closed
- the macroscopic properties of the system must be constant
- the equilibrium must be capable of being reached from either reactants or products

3. For each of the following reactions, identify whether:
i) maximum entropy favours the products or reactants
ii) minimum enthalpy favours the products or reactants
iii) the reaction will be spontaneous at any temperature, non-spontaneous at any temperature, or will form an equilibrium mixture of products and reactants:
a) $\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{I})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{I}) \leftrightarrow 2 \mathrm{H}_{3} \mathrm{O}^{+}(\mathrm{aq})+\mathrm{SO}_{4}^{2-}(\mathrm{aq})+$ heat

- maximum entropy favours the products
- minimum enthalpy favours the products
- the reaction will be spontaneous at all temperatures
b) $\mathrm{C}_{2} \mathrm{H}_{2}(\mathrm{~g})+2 \mathrm{CaO}(\mathrm{s}) \leftrightarrow \mathrm{CaC}_{2}(\mathrm{~s})+\mathrm{H}_{2} \mathrm{O}_{2}(\mathrm{I})+$ heat
- maximum entropy favours the reactants (because a gas is formed)
- minimum enthalpy favours the products
- the reaction is reversible so it will form an equilibrium mixture of reactants and products
c) $3 \mathrm{O}_{2}(\mathrm{~g})+$ energy $\leftrightarrow 2 \mathrm{O}_{3}(\mathrm{~g})$
- maximum entropy favours the reactants
- minimum enthalpy favours the reactants
- the reaction (as written) will be non-spontaneous at all temperatures
d) $\mathrm{H}_{2} \mathrm{O}$ (I) + heat $\leftrightarrow \mathrm{H}_{2} \mathrm{O}$ (g)
- maximum entropy favours the products
- minimum enthalpy favours the reactants
- the reaction is reversible so it will form an equilibrium mixture of reactants and products
e) $\mathrm{Zn}(\mathrm{s})+2 \mathrm{HCl}(\mathrm{aq}) \leftrightarrow \mathrm{ZnCl}_{2}(\mathrm{aq})+\mathrm{H}_{2}(\mathrm{~g})+$ heat
- maximum entropy favours the products
- minimum enthalpy favours the products
- the reaction is spontaneous at all temperatures
e) $\mathrm{PbI}_{2}(\mathrm{~s})+$ heat $+\mathrm{H}_{2} \mathrm{O}(\mathrm{I}) \leftrightarrow \mathrm{Pb}^{2+}(\mathrm{aq})+2 \mathrm{I}^{1-}(\mathrm{aq})$
- maximum entropy favours the products
- minimum enthalpy favours the reactants
- the reaction is reversible so it will form an equilibrium mixture of reactants and products

4. Which of the following reactions has the greatest increase in entropy?
a) $3 \mathrm{O}_{2}(\mathrm{~g}) \leftrightarrow 2 \mathrm{O}_{3}(\mathrm{~g})$
b) $\mathrm{N}_{2} \mathrm{H}_{4}(\mathrm{I})+2 \mathrm{H}_{2} \mathrm{O}_{2}(\mathrm{I}) \leftrightarrow \mathrm{N}_{2}(\mathrm{~g})+4 \mathrm{H}_{2} \mathrm{O}(\mathrm{g})$
c) $\mathrm{H}_{2} \mathrm{O}(\mathrm{I})+\frac{1}{2} \mathrm{O}_{2}(\mathrm{~g}) \leftrightarrow \mathrm{H}_{2} \mathrm{O}_{2}(\mathrm{I})$
d) $2 \mathrm{AgNO}_{3}(\mathrm{aq})+\mathrm{Na}_{2} \mathrm{~S}(\mathrm{aq}) \leftrightarrow 2 \mathrm{NaNO}_{3}(\mathrm{aq})+\mathrm{Ag}_{2} \mathrm{~S}(\mathrm{~s})$
e) $\mathrm{C}_{2} \mathrm{H}_{4}(\mathrm{~g})+2 \mathrm{O}_{2}(\mathrm{~g}) \leftrightarrow 2 \mathrm{CO}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{g})$

Reaction "b" shows the greatest increase in entropy. The reactants are all liquids and there are 5 particles of gas in the products.
5. For the following reaction at $25^{\circ} \mathrm{C}: \mathrm{N}_{2}(\mathrm{~g})+3 \mathrm{H}_{2}(\mathrm{~g}) \leftrightarrow 2 \mathrm{NH}_{3}(\mathrm{~g})$
$\Delta H=-91.8 \mathrm{~kJ}$ and $\Delta \mathrm{S}=-197 \mathrm{~J} / \mathrm{K}$. Calculate $\Delta G$ for this reaction. Which direction is favoured at this temperature?
( $\Delta G=-33.1 \mathrm{~kJ}$, forward rxn favoured)
6. Use Le Chatelier's principle to predict the effect of the following stresses on the reaction:

$$
2 \mathrm{~N}_{2} \mathrm{O}_{2}(\mathrm{~g})+\mathrm{H}_{2}(\mathrm{~g}) \leftrightarrow 2 \mathrm{~N}_{2} \mathrm{O}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{~g})+\text { heat }
$$

a) increasing concentration of $\mathrm{H}_{2}(\mathrm{~g})$ : $\longrightarrow$ f) removing $\mathrm{N}_{2} \mathrm{O}_{2}(\mathrm{~g})$
b) increasing the total pressure: no change
g) adding a catalyst: no change
c) adding $\mathrm{N}_{2} \mathrm{O}$ (g):
h) increasing temperature:
d) decreasing the amount of $\mathrm{H}_{2} \mathrm{O}(\mathrm{g}): \longrightarrow$
i) increasing the volume of the rxn vessel: no change
e) adding helium to the rxn vessel: no change
j) removing $\mathrm{N}_{2} \mathrm{O}(\mathrm{g})$ as it forms: $\longrightarrow$
7. Write the $\mathrm{K}_{\text {eq }}$ expressions for the following equilibrium reactions (careful of heterogeneous systems):
a) $\mathrm{S}(\mathrm{s})+\mathrm{O}_{2}(\mathrm{~g}) \leftrightarrow \mathrm{SO}_{2}(\mathrm{~g}) \quad \mathrm{Keq}=\frac{\left[\mathrm{SO}_{2}\right]}{\left[\mathrm{O}_{2}\right]}$
b) $2 \mathrm{NO}(g)+\mathrm{O}_{2}(\mathrm{~g}) \leftrightarrow 2 \mathrm{NO}_{2}(\mathrm{~g}) \quad \mathrm{Keq}=\frac{\left[\mathrm{NO}_{2}\right]^{2}}{\left[\mathrm{NO}^{2}\left[\mathrm{O}_{2}\right]\right.}$
c) $\mathrm{Pb}\left(\mathrm{NO}_{3}\right)_{2}(\mathrm{aq})+\mathrm{Zn}(\mathrm{s}) \leftrightarrow \mathrm{Zn}\left(\mathrm{NO}_{3}\right)_{2}(\mathrm{aq})+\mathrm{Pb}(\mathrm{s})$

$$
\mathrm{Keq}=\frac{\left[\mathrm{Zn}\left(\mathrm{NO}_{3}\right)_{2}\right]}{\left[\mathrm{Pb}\left(\mathrm{NO}_{3}\right)_{2}\right]}
$$

d) $\mathrm{N}_{2} \mathrm{H}_{4}(\mathrm{I})+\mathrm{H}_{2} \mathrm{O}_{2}(\mathrm{I}) \leftrightarrow \mathrm{N}_{2}(\mathrm{~g})+4 \mathrm{H}_{2} \mathrm{O}(\mathrm{g})$

Keq $=\left[\mathrm{N}_{2}\right]\left[\mathrm{H}_{2} \mathrm{O}\right]^{4}$
e) $\mathrm{Ba}(\mathrm{OH})_{2}(\mathrm{~s}) \leftrightarrow \mathrm{Ba}^{2+}(\mathrm{aq})+2 \mathrm{OH}^{1-}(\mathrm{aq})$
$\mathrm{Keq}=\left[\mathrm{Ba}^{2+}\right]\left[\mathrm{OH}^{1-}\right]^{2}$
f) $\mathrm{Na}_{2} \mathrm{CO}_{3}(\mathrm{~s})+\mathrm{H}_{2} \mathrm{O}(\mathrm{g})+\mathrm{CO}_{2}(\mathrm{~g}) \leftrightarrow 2 \mathrm{NaHCO}_{3}(\mathrm{~s})$

$$
\mathrm{Keq}=\frac{1}{\left[\mathrm{H}_{2} \mathrm{O}\right]\left[\mathrm{CO}_{2}\right]}
$$

g) 8. For the equilibrium reaction: $2 \mathrm{~N}_{2} \mathrm{O}_{2}(\mathrm{~g})+\mathrm{H}_{2}(\mathrm{~g}) \leftrightarrow 2 \mathrm{~N}_{2} \mathrm{O}(\mathrm{g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{g})+$ heat

At equilibrium, the concentrations of each species are measured. $\left[\mathrm{N}_{2} \mathrm{O}_{2}\right]=0.073 \mathrm{~mol} / \mathrm{L}$, $\left[\mathrm{H}_{2}\right]=0.012 \mathrm{~mol} / \mathrm{L},\left[\mathrm{N}_{2} \mathrm{O}\right]=0.634 \mathrm{~mol} / \mathrm{L},\left[\mathrm{H}_{2} \mathrm{O}\right]=0.484 \mathrm{~mol} / \mathrm{L}$.
a) Calculate the value of $\mathrm{K}_{\text {eq }}$ for the reaction at this temperature
b) Does the equilibrium favour the reactants or products at this temperature?
c) What is the value of $\mathrm{K}_{\text {eq }}$ for the reverse reaction at this temperature?
9. For the reaction: $2 \mathrm{HI}(\mathrm{g}) \leftrightarrow \mathrm{H}_{2}(\mathrm{~g})+\mathrm{I}_{2}(\mathrm{~g}) \quad \mathrm{K}_{\text {eq }}=62.5$ at $520^{\circ} \mathrm{C}$
a) Does this reaction favour the reactants or products at this temperature?

- Keq is greater than 1 , so the products are favoured at this temp
b) If the reaction is endothermic and the temperature is increased, what happens to the value of $\mathrm{K}_{\text {eq }}$ ?
- if the reaction is endothermic, as temperature is increased, the equilibrium will shift to the right and more product will form
- because there will be less reactant and more product, the value of Keq will increase as temperature increases
c) If 2.22 moles of HI are placed in a 5.00 L reaction vessel and allowed to come to equilibrium at $520^{\circ} \mathrm{C}$,
i) calculate the concentration of each species at equilibrium $\quad\left(\left[\mathrm{H}_{2}\right]=\left[\mathrm{I}_{2}\right]=0.209 \mathrm{M},[\mathrm{HI}]=0.026 \mathrm{M}\right)$
ii) at equilibrium, how many moles of $\mathrm{H}_{2}$ are present?
d) If the volume of the vessel is decreased, which way will the equilibrium shift? Why?
- if the volume of the vessel is decreased, there will be no effect on the position of the equilibrium because there are the same number of particles of gas on both sides of the equation

10. For the reaction: $\quad \mathrm{N}_{2} \mathrm{O}_{2}(\mathrm{~g}) \leftrightarrow \mathrm{N}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g})$
1.40 moles of $\mathrm{N}_{2} \mathrm{O}_{2}(\mathrm{~g})$ are placed in a 2.00 L reaction vessel and allowed to come to equilibrium. At equilibrium, there are 0.76 moles of $\mathrm{O}_{2}$ present in the vessel. Calculate the $\mathrm{K}_{\text {eq }}$ for this reaction. (0.45)
