Remember, when drawing electron dot diagrams:

- Write the symbol for the element and show only the outer (valence) electrons
- The number of valence electrons is equal to the Group Number (in Roman Numerals) for each element
- Follow the convention of only doubling up the electrons after all four "orbitals" have one electron each
eg. the electron dot diagram for phosphorus (Group V) would be
: P .

| Element | $\begin{gathered} \hline \text { Atomic } \\ \# \\ \hline \end{gathered}$ | Electron Configuration | Rutherford-Bohr Diagram | \# of Valence Electrons | $\begin{gathered} \hline \hline \text { Electron Dot } \\ \text { Diagram } \\ \hline \end{gathered}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Na | 11 | $1 s^{2} 2 s^{2} 2 p^{6} 3 s^{1}$ |  | 1 | Na ${ }^{\text {- }}$ |
| $\mathbf{M g}$ | 12 | $1 s^{2} 2 s^{2} 2 p^{6} 3 s^{2}$ |  | 2 | $\mathbf{M g} \cdot$ |
| 0 | 8 | $1 s^{2} 2 s^{2} 2 p^{4}$ |  | 6 | $\stackrel{\bullet}{0}$ |
| Al | 13 | $1 s^{2} 2 s^{2} 2 p^{6} 3 s^{2} 3 p^{1}$ |  | 3 | Al• |
| C | 6 | $1 \mathrm{~s}^{2} 2 \mathrm{~s}^{2} 2 \mathrm{p}^{2}$ |  | 4 | $\cdot \stackrel{\bullet}{\mathbf{C}}$ |
| $\mathbf{N}$ | 7 | $1 \mathrm{~s}^{2} 2 \mathrm{~s}^{2} 2 \mathrm{p}^{3}$ |  | 5 | $\cdot \mathbf{N} \cdot$ |

Homework:
After you have completed the above chart, draw the electron dot diagrams for atoms with atomic number $1,9,10,14,15,16,17,18,20,34,35,36,37,38,52,53,54,55,56$ and 85

| Atomic \#1: hydrogen H• | Atomic \#9: fluorine $\bullet \stackrel{\bullet}{\mathbf{F}}$ • | Atomic \#10: neon <br> $\bullet$ - Ne : | Atomic \#14: silicon <br> - $\mathbf{S i}$ - |

1. Use EDDs to show the formation of the ionic compounds between:
a) Li and P

b) Sc and N

c) Ba and O

d) Al and S

Questions from pages 73-74 of text:
Q9. Follow steps as shown above
a) lithium iodide will have the chemical formula LiI
b) barium chloride will have the formula $\mathrm{BaC}_{2}$
c) potassium oxide will have the formula $\mathrm{K}_{2} \mathrm{O}$
d) calcium fluoride will have the formula $\mathrm{CaF}_{2}$

Q12. All five halogens will have seven valence electrons in their valence shell. Because all of these elements have the same number of valence electrons, they are part of a chemical family.

Q13. Follow steps as shown above
a) magnesium chloride: $\mathrm{MgCl}_{2}$
b) sodium sulfide: $\mathrm{Na}_{2} \mathrm{~S}$
c) aluminum oxide: $\mathrm{Al}_{2} \mathrm{O}_{3}$
d) barium chloride: $\mathrm{BaCl}_{2}$
e) calcium fluoride: $\mathrm{CaF}_{2}$
f) sodium iodide: NaI
g) potassium chloride: $\mathrm{KC} \ell$

Sketch of a crystal lattice:

1. Define octet rule, covalent bond, bonding capacity, molecular formula. See notes.
2. Explain how a formula unit of an ionic compound is different from the molecular formula of a covalent compound.

A formula unit is the lowest possible ratio in which the ions combine in an ionic compound. Because all of the negative ions are attracted to all of the positive ions in an ionic compound, the ions arrange themselves in a huge three-dimensional structure called a "crystal lattice". There are many positive and negative ions in the crystal lattice, so the formula unit indicates the simplest ratio of positive to negative ions. For example, in calcium chloride $\left(\mathrm{CaCl}_{2}\right)$, there are two chloride ions for every one calcium ion.

A molecular formula of a covalent compound is the exact number of each type of atom present in one discrete molecule. For example, glucose has the molecular formula $\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}$ which tells us that there are 6 carbon atoms, 12 hydrogen atoms and 6 oxygen atoms all chemically bonded together to form one molecule. The molecular formula of a covalent compound can NOT be reduced to lower terms, because then it would no longer be the same substance.
3. Draw the Lewis structures (structural formulas) for the following molecules. Be sure to draw in all unshared electron pairs.
a) $\mathrm{Br}_{2}$

e) $\mathrm{P}_{2} \mathrm{H}_{4}$

i) $\mathrm{C}_{2} \mathrm{H}_{6}$

m) $\mathrm{N}_{2} \mathrm{H}_{2}$

## $\mathbf{H}-\ddot{\mathrm{N}}=\ddot{\mathrm{N}}-\mathbf{H}$

q) $\mathrm{C}_{3} \mathrm{H}_{8}$

b) $\mathrm{C} \ell \mathrm{F}$

f) $\mathrm{CHCl}_{3}$

Cle Cle Cle Cle

## Answers to Homework: Classifying Bonds and the Bonding Continuum

1. Read over this note very carefully.
2. For the following bonds:
a) calculate the difference in electronegativity ( $\triangle \mathrm{EN}$ ) between the bonding atoms
b) determine the type of bonding that will occur: non-polar, polar or ionic

- if the bond is non-polar, it is uncharged so do not draw in any charged regions
- if the bond is polar, label the appropriate atoms with partial positive ( $\delta+$ ) and partial negative ( $\delta-$ ) charges
- if the bond is ionic, label the appropriate atoms with full positive $(+)$ and full negative $(-)$ charges

| $\delta+\mathrm{H}-\mathrm{O}{ }^{\delta-}$ $\begin{aligned} \Delta \mathrm{EN} & =3.44-2.20 \\ & =1.24 \end{aligned}$ <br> polar bond, so draw in partial charges | $\begin{aligned} & +\mathrm{Na}-\mathrm{Br}^{-} \\ \triangle \mathrm{EN} & =2.96-0.93 \\ & =2.03 \end{aligned}$ <br> ionic bond, so draw in full + and - charges | $\begin{aligned} &+ \\ & \mathrm{Mg}-\mathrm{O}^{-} \\ & \triangle \mathrm{EN}=3.44-1.31 \\ &=2.13 \end{aligned}$ <br> ionic bond, so draw in full + and - charges | $\begin{aligned} \delta^{+} & \mathrm{C}-\mathrm{F}^{\delta-} \\ \Delta \mathrm{EN} & =3.98-2.55 \\ & =1.43 \end{aligned}$ <br> polar bond, so draw in partial charges |
| :---: | :---: | :---: | :---: |
| $\begin{gathered} \mathrm{H}-\mathrm{S} \\ \begin{aligned} \Delta \mathrm{EN}= & 2.58-2.20 \\ = & 0.38 \end{aligned} \end{gathered}$ <br> non-polar covalent bond, do not draw any charges | $\begin{aligned} & \mathrm{N}-\mathrm{O} \\ & \begin{aligned} \mathrm{EN} & =3.44-3.04 \\ & =0.40 \end{aligned} \end{aligned}$ <br> non-polar covalent bond, do not draw any charges | $\begin{gathered} \mathrm{P}-\mathrm{H} \\ \begin{aligned} \mathrm{EN}= & =2.20-2.19 \\ = & 0.01 \end{aligned} \end{gathered}$ <br> non-polar covalent bond, do not draw any charges | $\begin{gathered} \delta^{\delta+} \mathrm{B}-\mathrm{Cl}^{\delta-} \\ \begin{array}{l} \Delta \mathrm{EN}=3.16-2.04 \\ \quad=1.12 \\ \text { polar covalent bond, so } \\ \text { draw in partial charges } \end{array} \end{gathered}$ |
| $\begin{aligned} &+ \mathrm{K}-\mathrm{Cl} \\ &- \\ & \Delta \mathrm{EN}=3.16-0.82 \\ &=2.34 \end{aligned}$ <br> ionic bond, so draw in full + and - charges | $\begin{gathered} \mathrm{C}-\mathrm{H} \\ \begin{aligned} \mathrm{EN} & =2.55-2.20 \\ = & 0.35 \end{aligned} \end{gathered}$ <br> non-polar covalent bond, do not draw any charges | $\begin{gathered} \delta^{\delta-} \mathrm{F}-\mathrm{Se}^{\delta+} \\ \begin{array}{l} \mathrm{EN}=3.98-2.55 \\ \quad=1.43 \\ \text { polar covalent bond, so } \\ \text { draw in partial charges } \end{array} \end{gathered}$ | $\begin{aligned} & \mathrm{S}-\mathrm{C} \\ & \begin{aligned} \mathrm{EN}= & 2.58-2.55 \\ = & 0.03 \end{aligned} \end{aligned}$ <br> non-polar covalent bond, do not draw any charges |

3. Give three examples of bonds for which $\Delta \mathrm{EN}=0.0$.

Any bond between atoms of the same element will have $\Delta \mathrm{EN}=0.0$, for example, $\mathrm{O}-\mathrm{O}, \mathrm{H}-\mathrm{H}$, $\mathrm{Br}-\mathrm{Br}$, and any of the other HOBrFINCl elements, or $\mathrm{C}-\mathrm{C}$ bonds etc. Do not use metal - metal as your example, because two metal atoms do not bond in this way.
4. For the following molecules, determine the type of bond(s) and label any partial or full charges.

Hydrogen cyanide (a poisonous gas) HCN

$$
\begin{aligned}
& \mathbf{H}-\mathbf{C} \overline{\mathbf{N}} \\
& \\
& \Delta \mathrm{EN}_{\mathrm{C}-\mathrm{H}}=2.55-2.20 \\
&=0.35 \therefore \text { non-polar bond } \\
& \Delta \mathrm{EN}_{\mathrm{C}-\mathrm{N}}=3.04-2.55 \\
&=0.49 \therefore \text { non-polar bond }
\end{aligned}
$$

no polar bonds, so do not draw in any charges

Dihydrogen Monoxide (water) $\mathbf{H}_{2} \mathrm{O}$

$$
{ }^{\delta+} \mathbf{H}-\underset{\substack{0}}{\ddot{\mathbf{O}}}-\mathbf{H}^{\delta+}
$$

$\Delta \mathrm{EN}=3.44-2.20$

$$
=1.24
$$

$\therefore$ polar bond, so draw in partial charges

| Methanol (a poisonous alcohol) $\mathrm{CH}_{3} \mathrm{OH}$ | Formic Acid (in red ant stings) HCOOH |

Answers to Homework:
Using Polarity of Molecules to Predict Physical Properties of Substances
This chart summarizes the strength of intermolecular attraction and resulting physical properties for the compounds from the Unit 03 Handouts to Print: Practice Determining the Polarity of Molecules.

| Compound | Description of Molecule | Polarity of Molecules | Description of Charges | Strength of IMFs | Predicted State at SATP | Predicted Melting and Boiling Points | Predicted Solubility in Water |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{CO}_{2}$ | Symmetrical | Non-polar | No charges | Very Weak | Gas | Very low | Insoluble |
| $\mathrm{H}_{2} \mathrm{~S}$ | Asymmetrical with no polar bonds | Slightly polar | Slight partial charges (do not label) | Weak | Gas | Low | Slightly soluble |
| $\mathrm{CH}_{2} \mathrm{O}$ | Asymmetrical with at least one polar bond | Very polar | Partial charges (label $\delta-\& \delta+$ on polar bonds) | Medium | Liquid | Low/medium | Soluble |
| NOF | Asymmetrical with at least one polar bond | Very polar | Partial charges (label $\delta-\& \delta+$ on polar bonds) | Medium | Liquid | Low/medium | Soluble |
| $\mathbf{P H}_{2} \mathrm{I}$ | Asymmetrical with no polar bonds | Slightly polar | Slight partial charges (do not label) | Weak | Gas | Low | Slightly soluble |
| CF4 | Symmetrical | Non-polar | No charges | Very Weak | Gas | Very low | Insoluble |
| $\mathbf{N H}_{3}$ | $\begin{aligned} & \text { Asymmetrical } \\ & \text { with at least } \\ & \text { one N-H, O-H } \\ & \text { or F-H bond } \end{aligned}$ | Very polar + hydrogen bonding | Strong partial charges (label on polar bonds) | Strong | Gas/Liquid -because $\mathrm{NH}_{3}$ weighs very little, it is a gas | Medium | Completely Soluble |
| $\mathrm{SF}_{2}$ | Asymmetrical with at least one polar bond | Very polar | Partial charges (label $\delta-\& \delta+$ on polar bonds) | Medium | Liquid | Low/medium | Soluble |
| $\mathrm{CBr}_{2} \mathbf{I}_{2}$ | Asymmetrical with no polar bonds | Slightly polar | Slight partial charges (do not label) | Weak | Gas | Low | Slightly soluble |
| HCN | Asymmetrical with no polar bonds | Slightly polar | Slight partial charges (do not label) | Weak | Gas | Low | Slightly soluble |
| $\mathrm{CSF}_{2}$ | Asymmetrical with at least one polar bond | Very polar | Partial charges (label $\delta-\& \delta+$ on polar bonds) | Medium | Liquid | Low/medium | Soluble |
| PClO | Asymmetrical with at least one polar bond | Very polar | Partial charges (label $\delta-\& \delta+$ on polar bonds) | Medium | Liquid | Low/medium | Soluble |
| CS ${ }_{2}$ | Symmetrical | Non-polar | No charges | Very Weak | Gas | Very low | Insoluble |
| NSI | Asymmetrical with no polar bonds | Slightly polar | Slight partial charges (do not label) | Weak | Gas | Low | Slightly soluble |
| $\mathrm{AsCl}_{3}$ | Asymmetrical with at least one polar bond | Very polar | Partial charges (label $\delta-\& \delta+$ on polar bonds) | Medium | Liquid | Low/medium | Soluble |

* Make sure you know why NOF, $\mathrm{CH}_{2} \mathrm{O}$ and HCN molecules are NOT able to hydrogen bond to each other
