## Introduction to Solutions: Practice Questions

Read pages 264, 266-267 of Nelson Chemistry 11 and refer to your class notes (including the notes from the first unit) to answer the following questions:

1. Define the following terms:
a) matter, pure substance, mixture, element, compound, solution, mechanical mixture
b) aqueous solution, alloy
c) solvent, solute, homogeneous, heterogeneous, phase
d) electrolyte, non-electrolyte
2. Why is water known as the "universal solvent"? (page 264)

Water is known as the universal solvent because most substances dissolve, at least a little bit, in water.
3. List six unwanted substances that are commonly dissolved in water supplies. (page 264)

- paints
- cleaners
- industrial waste
- insecticides
- fertilizers
- road salt

4. Explain why homogenized milk is not considered to be a solution. (page 266).

Homogenized milk has been treated to break the fat up into tiny droplets so that it will stay evenly mixed in the milk. If you look at milk under a microscope, you can see that the fat droplets are separate from the watery part of the milk, they are not dissolved in the milk. Because milk has these two phases, it is not a solution. Also, if milk were a solution, it would be transparent because it is aqueous.
5. Are all solutions transparent? Give an example to defend your answer.

No, not all solutions are transparent. Alloys such as sterling silver and brass are solid in solid solutions and they are opaque, not transparent. However, all aqueous solutions are transparent.
6. Are all aqueous solutions transparent? Yes.
7. Are all aqueous solutions colourless?

No. Many aqueous solutions have lovely colours, for example, nickel (II) nitrate is green, copper (II) sulfate is blue and iron (III) nitrate is yellow.
8. What type of compounds are electrolytes? What type of compounds are non-electrolytes?

Ionic compounds are electrolytes because they dissociate in water to form ions. Covalent compounds (molecular substances) are non-electrolytes.
9. Identify the solute(s) and solvent in each of the following solutions.

| Solution | Solvent | Solute(s) |
| :---: | :---: | :---: |
| a) sterling silver (often stamped with the number 925) is an alloy of $92.5 \%$ silver and $7.5 \%$ copper | silver | copper |
| b) tincture of iodine is 3\% solid iodine dissolved in $97 \%$ ethanol (alcohol) | ethanol | iodine |
| c) brass is $85 \%$ copper and $15 \%$ zinc | copper | zinc |
| d) "regular" gasoline is a mixture of $87 \%$ octane with other hydrocarbons | octane | other hydrocarbons |
| e) bronze can be made by melting together $80 \%$ copper and $20 \%$ tin | copper | tin |
| f) stainless steel is a homogeneous mixture of approximately $78 \%$ iron, $15 \%$ chromium and $7 \%$ nickel | iron | chromium nickel |
| g) air is $78 \%$ nitrogen, $20.9 \%$ oxygen and $1 \%$ trace gases ( $\mathrm{Ar}, \mathrm{Ne}, \mathrm{CH}_{4}, \mathrm{CO}_{2}$, He etc) | nitrogen gas | oxygen, Ar, Ne, $\mathrm{CH}_{4}, \mathrm{CO}_{2}$, He etc |
| h) carbonated water is made by dissolving about 1.8 g of carbon dioxide in 1.0 L of water | water | carbon dioxide |

10. Answer questions 1, 2, 4, 5 and 6 on page 269. (Note: the text uses the term "molecular" to indicate a covalent compound)

Q1a) fresh squeezed orange juice- heterogeneous because of the pulp
b) white vinegar- homogeneous because it is transparent
c) red wine- heterogeneous because there is sediment in wine that settles out, and it is not transparent
d) antique bronze dagger- heterogeneous because you can see where the bronze has pitted and discoloured (different colours mean that there are different materials present)
e) a stainless steel knife- if the knife is all made of stainless steel, then it should be homogeneous because the whole knife should look the same
f) an old lead water pipe- heterogeneous because the pipe will be corroded and filled with deposits on the inside of the pipe
g) humid air- if the air is so humid that it looks foggy, then it is heterogeneous because the water is present as little droplets in the air. If the air is humid but still transparent, then it is homogeneous.
h) a cloud- heterogeneous because it is not transparent. Clouds contain water droplets, ice crystals and small bits of dirt, pollen and even salt crystals from the ocean.
i) a dirty puddle- heterogeneous because the dirt will settle out from the water with time.

Q2a) milk is not a solution because it is not transparent
b) apple juice is a solution if it is transparent. Fresh squeezed apple juice from a farm (fresh cider) is not a solution because it is not transparent
c) the gas in a helium balloon is homogeneous (it is air with helium, evenly mixed)
d) pop is homogeneous as long as it is sealed and there are no bubbles present. If you open the pop and the bubbles come out of solution, then it is no homogeneous
e) pure water is homogeneous
f) smoke filled air is heterogeneous because the particles of soot are not evenly mixed the colour of the smoke varies
g) silt-filled water is heterogeneous because the silt (fine particles of dirt and mud) will settle out of the water over time
h) rainwater is heterogeneous because it has tiny little bits of dirt and pollen in it (you can separate them from the water by filtering it)
i) 14 K gold is homogeneous, it is an alloy so it is evenly mixed

## Practice Questions: Solubility Curves

1. Define: concentration, dilute solution, concentrated solution, saturated solution, unsaturated solution, super-saturated solution, solubility.

2. From the solubility curves above, how many grams of copper (II) sulfate can dissolve in:
a) 100 mL of water at $40^{\circ} \mathrm{C}: 29 \mathrm{~g}$
b) 50 mL of water at $80^{\circ} \mathrm{C}: 27$ or $\mathbf{2 8} \mathbf{g}$
c) 10 mL of water at $100^{\circ} \mathrm{C}: 7.5 \mathrm{~g}$
d) 250 mL of water at $60^{\circ} \mathrm{C}: 100 \mathrm{~g}$
3. From the solubility curves above, how many grams of barium hydroxide can dissolve in:
a) 100 mL of water at $20^{\circ} \mathrm{C}: 4$ or 5 g
b) 50 mL of water at $90^{\circ} \mathrm{C}: 70 \mathrm{~g}$
c) 10 mL of water at $80^{\circ} \mathrm{C}: 10 \mathbf{g}$
d) 250 mL of water at $60^{\circ} \mathrm{C}: 75 \mathrm{~g}$
4. From the solubility curves above, what is the minimum temperature required to dissolve:
a) 60 g of $\mathrm{Pb}\left(\mathrm{NO}_{3}\right)_{2}$ in 100 mL of water: 23 or $\mathbf{2 4}{ }^{\circ} \mathbf{C}$
b) 20 g of calcium acetate in 50 mL of water: $20^{\circ} \mathbf{C}$
c) 80 g of $\mathrm{CuSO}_{4}$ in 200 mL water: $\mathbf{6 0}^{\circ} \mathbf{C}$
d) 35 g of $\mathrm{Ba}(\mathrm{OH})_{2}$ in 25 mL water: 90 or $91^{\circ} \mathrm{C}$
5. At what temperatures are the solubilities of the following substances equal?
a) copper (II) sulfate and barium hydroxide: 65 or $66^{\circ} \mathrm{C}$
c) calcium acetate and lead (II) nitrate: $\mathbf{8}$ or $\mathbf{9}^{\circ} \mathrm{C}$
b) lead (II) nitrate and barium hydroxide: $\mathbf{8 6}$ ot $\mathbf{8 7}{ }^{\circ} \mathrm{C}$
d) calcium acetate and copper (II) sulfate: $47^{\circ} \mathrm{C}$
6. Are the following solutions saturated (S), unsaturated (U) or super-saturated (SS) at the temperatures below?
a) 100 g of lead nitrate in 100 mL water at $30^{\circ} \mathrm{C}$ : SS
b) 20 g copper sulfate in 50 mL water at $80^{\circ} \mathrm{C}: \mathbf{U}$
c) 15 g of $\mathrm{Ba}(\mathrm{OH})_{2}$ in 25 mL water at $70^{\circ} \mathrm{C}: \mathrm{S}$
d) 1 g of $\mathrm{Ca}\left(\mathrm{CH}_{3} \mathrm{COO}\right)_{2}$ in 10 mL water at $90^{\circ}: \mathbf{U}$
7. What is unusual about the solubility curve for calcium acetate? Solubility of calcium acetate decreases at temperature increases. For most solids in solution, solubility increases with temperature.
8. A hot solution of barium hydroxide contains 200 g of solute per 100 mL of water. The solution is cooled to $20^{\circ} \mathrm{C}$. What mass of solid will form as the solution is cooled?
There are 200 g of barium hydroxide in the solution, but at $20^{\circ} \mathrm{C}$ the solution is saturated with 5 grams of barium hydroxide. So, if a seed crystal is added, $(200 \mathrm{~g}-5 \mathrm{~g})=195 \mathrm{~g}$ of solid will precipitate out.

## Properties of Acids and Bases

| Property | Acids | Bases |
| :---: | :---: | :---: |
| Arrhenius Definition | a substance which dissolves in water to produce $\mathrm{H}+$ ions | a substance which dissolves in water to produce OH - ions |
| Examples | $\underset{\substack{\mathbf{H}_{2} \mathrm{SO}_{4} \\ \mathrm{H}_{3} \mathrm{HO}_{4}}}{\mathrm{HI}}$ | $\begin{gathered} \mathrm{NaOH} \quad \mathrm{KOH} \\ \mathrm{Ca}(\mathrm{OH})_{2} \\ \mathrm{NH}_{3} \\ \mathrm{Al}(\mathrm{OH})_{3} \end{gathered}$ |
| Produced by which type of element or oxide dissolving in water (metals or non-metals) | non-metals | metals |
| Which ion is responsible for their properties? | H+ | OH- |
| Does the aqueous solution conduct electricity? | Yes (acids are electrolytes) | Yes (bases are electrolytes) |
| Taste | sour | bitter |
| Skin feel | watery | slippery |
| Colour with red or blue litmus paper | red | blue |
| Colour with phenolphthalein | colourless | pink |
| Colour with bromothymol blue | yellow | blue |
| Reaction with metals | produce $\mathbf{H}_{\mathbf{2}}$ gas and a salt | no reaction |
| Reaction with carbonates | produce $\mathrm{CO}_{2}$ gas, liquid water and a salt | no reaction |
| pH | less than 7.0 | greater than 7.0 |

Label the $\mathbf{p H}$ scale:

## Reactions of Acids and Bases

Write balanced chemical equations for the reactions between the following substances. Include the states of all substances. Be sure that you can name all of the compounds from these equations.

1. $2 \mathrm{HCl}(\mathrm{aq})+2 \mathrm{Li}(\mathrm{s}) \quad \rightarrow \quad \mathrm{H}_{2}(\mathrm{~g}) \quad+\quad 2 \mathrm{LiCl}(\mathrm{aq})$
2. $2 \mathrm{HNO}_{3}(\mathrm{aq})+\mathrm{Mg}(\mathrm{s}) \quad \rightarrow \quad \mathrm{H}_{2}(\mathrm{~g}) \quad+\quad \mathrm{Mg}\left(\mathrm{NO}_{3}\right)_{2}(\mathrm{aq})$
3. $2 \mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}(\mathrm{aq})+\mathrm{K}_{2} \mathrm{CO}_{3}(\mathrm{aq}) \rightarrow \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{CO}_{2}(\mathrm{~g})+2 \mathrm{KC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}(\mathrm{aq})$
4. $\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})+\mathrm{CaCO}_{3}(\mathrm{~s}) \rightarrow \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{CO}_{2}(\mathrm{~g})+\mathrm{CaSO}_{4}(\mathrm{~s})$
5. $\mathrm{KOH}(\mathrm{aq})+\mathrm{HCl}(\mathrm{aq}) \rightarrow \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{KCl}(\mathrm{aq})$
6. $\mathrm{Ca}(\mathrm{OH})_{2}(\mathrm{~s})+\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq}) \quad \rightarrow \quad 2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{CaSO}_{4}(\mathrm{~s})$
7. nitrous acid + zinc metal

$$
2 \mathrm{HNO}_{2}(\mathrm{aq})+\mathrm{Zn}(\mathrm{~s}) \quad \rightarrow \quad \mathrm{H}_{2}(\mathrm{~g}) \quad+\mathrm{Zn}\left(\mathrm{NO}_{2}\right)_{2}(\mathrm{aq})
$$

8. acetic acid + ammonium hydroxide

$$
\mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}(\mathrm{aq})+\mathrm{NH}_{4} \mathrm{OH}(\mathrm{aq}) \quad \rightarrow \quad \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{NH}_{4} \mathrm{C}_{2} \mathrm{H}_{3} \mathrm{O}_{2}(\mathrm{aq})
$$

9. hypobromous acid + aluminum metal

$$
6 \mathrm{HBrO}(\mathrm{aq})+2 \mathrm{Al}(\mathrm{~s}) \quad \rightarrow \quad 3 \mathrm{H}_{2}(\mathrm{~g})+2 \mathrm{Al}(\mathrm{BrO})_{3}(\mathrm{aq})
$$

10. ammonium hydroxide (aq) + hypophosphorous acid

$$
3 \mathrm{NH}_{4} \mathrm{OH}(\mathrm{aq})+\mathrm{H}_{3} \mathrm{PO}_{3}(\mathrm{aq}) \rightarrow 3 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\left(\mathrm{NH}_{4}\right)_{3} \mathrm{PO}_{3}(\mathrm{aq})
$$

11. $2 \mathrm{HBr}(\mathrm{aq})+2 \mathrm{Na}(\mathrm{s}) \rightarrow \mathrm{H}_{2}(\mathrm{~g}) \quad+\quad 2 \mathrm{NaBr}(\mathrm{aq})$
12. $\mathrm{HClO}_{4}(\mathrm{aq})+\mathrm{LiOH}(\mathrm{aq}) \rightarrow \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{LiClO}_{4}(\mathrm{aq})$
13. $3 \mathrm{HNO}_{3}(\mathrm{aq})+\mathrm{Al}(\mathrm{OH})_{3}(\mathrm{~s}) \rightarrow 3 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{Al}\left(\mathrm{NO}_{3}\right)_{3}(\mathrm{aq})$
14. $\mathrm{H}_{2} \mathrm{SO}_{3}(\mathrm{aq})+\mathrm{MgCO}_{3}(\mathrm{~s}) \rightarrow \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{CO}_{2}(\mathrm{~g})+\mathrm{MgSO}_{3}(\mathrm{~s})$

## Strength, Concentration and $\mathbf{p H}$ of Acids and Bases

1. Name the following acids, and then classify them as strong or weak and concentrated or dilute:

|  <br> Chemical Formula | Name of Acid | Strong or <br> Weak? | Concentrated or <br> Dilute? |
| :--- | :---: | :---: | :---: |
| $3.0 \mathrm{M} \mathrm{H} \mathrm{HO}_{3}$ | carbonic acid | weak | dilute |
| 7.0 M HI | hydroiodic acid | strong | concentrated |
| $12.0 \mathrm{M} \mathrm{H}_{2} \mathrm{SO}_{3}$ | sulfurous acid | weak | concentrated |
| $1.0 \mathrm{M} \mathrm{HBrO}_{3}$ | bromic acid | weak | dilute |
| $15.0 \mathrm{M} \mathrm{HCH}_{3} \mathrm{COO}$ | acetic acid | weak | concentrated |
| 0.50 M HI | hydroiodic acid | strong | dilute |
| 6.0 M HF | hydrofluoric acid | weak | concentrated |
| $0.001 \mathrm{M} \mathrm{HNO}_{2}$ | nitrous acid | weak | dilute |

2. Name the following bases, and then classify them as strong or weak and concentrated or dilute:

|  <br> Chemical Formula | Name of Base | Strong or <br> Weak? | Concentrated or <br> Dilute? |
| :--- | :---: | :---: | :---: |
| $2.0 \mathrm{M} \mathrm{Sr}(\mathrm{OH})_{2}$ | strontium hydroxide | strong | dilute |
| $6.0 \mathrm{M} \mathrm{NH} \mathrm{H}_{4} \mathrm{OH}$ | ammonium hydroxide | weak | concentrated |
| 9.0 M CaO | calcium oxide | strong | concentrated |
| 0.10 M AgOH | silver hydroxide | weak | dilute |
| 3.0 M LiOH | lithium hydroxide | strong | dilute |
| $0.01 \mathrm{M} \mathrm{Sn}(\mathrm{OH})_{4}$ | tin (IV) hydroxide | weak | dilute |
| 8.0 M Na 2 O | sodium oxide | strong | concentrated |
| $1.5 \mathrm{M} \mathrm{Sa}(\mathrm{OH})_{2}$ | barium hydroxide | strong | dilute |

3. Circle the acid in each group which is the stronger electrolyte: (stronger acid)
a) $\mathrm{H}_{2} \mathrm{CO}_{3}$ or $\mathrm{H}_{2} \mathrm{SO}_{4}$
c) HCl or HClO
b) $\mathrm{HNO}_{3}$ or $\mathrm{HNO}_{2}$
d) $\mathrm{H}_{2} \mathrm{SO}_{4}$ or $\mathrm{H}_{2} \mathrm{SO}_{3}$
e) HBr or $\mathrm{HI} \mathrm{HBrO}_{2}$
4. Circle the base in each group which will have the higher pH : (stronger base)
a) $\mathrm{NH}_{4} \mathrm{OH}$ or NaOH
c) SrO Or
SnO
b) $\mathrm{Ca}(\mathrm{OH})_{2}$ or $\mathrm{Cd}(\mathrm{OH})_{2}$
d) AgOH or LiOH
e) $\mathrm{Cr}_{2} \mathrm{O}_{3}$ or $\mathrm{Cs}_{2} \mathrm{O}$
f) $\mathrm{H}_{2} \mathrm{O}$

5. Are the following bases soluble (aq) or insoluble (s) in water?
a) $\mathrm{Ca}(\mathrm{OH})_{2}:$ soluble (aq)
c) LiOH :
soluble (aq)
e) $\mathrm{Al}(\mathrm{OH})_{3}:$ insoluble $(\mathrm{s})$
b) $\mathrm{Ni}(\mathrm{OH})_{3}$ : insoluble ( s )
d) $\mathrm{Mn}(\mathrm{OH})_{2}$ : insoluble (s)
f) $\mathrm{NH}_{4} \mathrm{OH}$ : soluble (aq)
6. Answer the following questions using the pH values for common substances in the chart:
a) The strongest base is: oven cleaner
b) The acid which will be the best conductor of electricity in solution is: stomach acid
c) Two (approximately) neutral substances: milk and blood
d) One substance that has ionized: any of the acids
e) One substance that will be blue with blue litmus paper : any of the bases
f) One substance that will be colourless with phenolphthalein: any of the acids
g) One weak acid: tomato juice, dill pickles or lemon juice

| Window Cleaner | $\mathrm{pH}=11$ |
| :--- | :--- |
| Lemon juice | $\mathrm{pH}=2$ |
| Stomach acid $(\mathrm{HCl})$ | $\mathrm{pH}=1.5$ |
| Tomato juice | $\mathrm{pH}=4.7$ |
| Oven cleaner $(\mathrm{NaOH})$ | $\mathrm{pH}=14$ |
| Dill pickles | $\mathrm{pH}=3.3$ |
| Milk | $\mathrm{pH}=6.6$ |
| Trisodium phosphate $(\mathrm{TSP})$ | $\mathrm{pH}=13$ |
| Sea water | $\mathrm{pH}=8.4$ |
| Blood | $\mathrm{pH}=7.4$ |

## Practice Questions: Concentrations of Acids and Bases

1. Calculate the volume of $15.0 \mathrm{M} \mathrm{HNO}_{3}$ stock solution that is required to make 2.5 L of 1.25 M solution.
2. Calculate the mass of solid barium hydroxide that is needed to make 300.0 mL of 0.200 M solution.
3. 75.0 mL of 18.0 M sulfuric acid stock solution is diluted to make 1.00 L . What is the final concentration of this solution?
4. Calculate the final concentration of a solution that is made by dissolving 14.8 g of solid sodium hydroxide in 600.0 mL of solution.
5. 25.0 mL of 3.66 M ammonium hydroxide solution is diluted to make a final solution with a concentration of 1.50 M . What is the volume of the finished solution?
6. A biochemist needs a 0.0250 M solution of citric acid $\left(\mathrm{H}_{3} \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{O}_{7}\right)$ for an experiment. Citric acid is solid at SATP.
a) Is citric acid a strong or weak acid?
b) To what extent will citric acid ionize in water?
c) What mass of pure citric acid is required to make 680 mL of 0.0250 M solution?
7. Describe the steps that you would follow if you were making 500.0 mL of a 0.200 M solution of calcium hydroxide. Be complete.
[^0]
[^0]:    Answers:

    1. 210 mL of $\mathrm{HNO}_{3}$ stock solution is needed (rounded from 208 mL , to 2 sig digs)
    2. 10.3 g of $\mathrm{Ba}(\mathrm{OH})_{2}$ required
    3. 1.35 M is the final concentration
    4. 0.617 M
    5. $\quad 61.0 \mathrm{~mL}$ or 0.0610 L is the final volume

    6a) weak
    6b) it will only slightly ionize (it will be a weak electrolyte)
    6c) 3.3 g of citric acid is needed (rounded from 3.266 g , to 2 sig digs)
    7. Steps in making 500.0 mL of a $0.200 \mathrm{M} \mathrm{Ca}(\mathrm{OH})_{2}$ solution:

    - weigh out 7.41 g of solid $\mathrm{Ca}(\mathrm{OH})_{2}$
    - get a clean 500.0 mL volumetric flask, fill it about $2 / 3 \mathrm{~s}$ with distilled water
    - add the solid $\mathrm{Ca}(\mathrm{OH})_{2}$ to the flask and swirl until it dissolves
    - let the solution cool
    - add distilled water until the bottom of the meniscus is just touching the etched line of the flask. Cover and mix.
