

Unit 6, Lesson 03: Calculations Involving Strong Acids and Bases

1. Calculate the pH of the following solutions:

a) **0.025 M LiOH (aq)**

LiOH is a strong base, from Group I $\therefore [OH^{1-}] = [LiOH]$

$$pOH = -\log [OH^{1-}]$$

$$= -\log [0.025]$$

$$= 1.60206$$

$$pH = 14 - pOH$$

$$= 14 - 1.60206$$

$$= 12.40$$

2 sig digs
in the
concentration
gives 2
decimals in
the pH

b) **3.00 HI (aq)**

HI is a strong acid $\therefore [H_3O^{1+}] = [HI]$

$$pH = -\log [H_3O^{1+}]$$

$$= -\log [3.00]$$

$$= -0.477$$

3 sig digs in the concentration gives
3 decimals in the pH

c) **0.060 M Ba(OH)₂ (aq)**

Ba(OH)₂ is a strong base, from Group II $\therefore [OH^{1-}] = 2 \times [Ba(OH)_2] = 0.12 \text{ M}$

$$pOH = -\log [OH^{1-}]$$

$$= -\log [0.12]$$

$$= 0.9208$$

$$pH = 14 - pOH$$

$$= 14 - 0.9208$$

$$= 13.08$$

2 sig digs
in the
concentration
gives 2
decimals in
the pH

d) 5.00 M H₂SO₄ (aq)

H₂SO₄ is a strong acid ∴ [H₃O¹⁺] = [H₂SO₄]

$$\text{pH} = -\log [\text{H}_3\text{O}^{1+}]$$

$$= -\log [5.00]$$

$$= -0.699$$

3 sig digs in the concentration gives
3 decimals in the pH

remember, only the first proton (H⁺) in H₂SO₄ ionizes significantly unless the acid is very dilute

e) 25 mL of 15.0 M HNO₃ stock solution diluted to 1.0 L of solution

Calculate the concentration of the diluted acid using the dilution equation: C₁V₁ = C₂V₂

* both volumes must be in the same units, convert 25 mL to L by dividing by 1000

$$C_1V_1 = C_2V_2$$

$$0.025 \text{ L} \times 15.0 \text{ M} = C_2 \times 1.0 \text{ L}$$

$$C_2 = \frac{0.025 \text{ L} \times 15.0 \text{ M}}{1.0 \text{ L}}$$

$$= 0.375 \text{ M}$$

HNO₃ is a strong acid, therefore:

$$[\text{H}_3\text{O}^+] = [\text{HNO}_3] = C_2$$

$$\text{pH} = -\log [\text{H}_3\text{O}^{1+}]$$

$$= -\log [0.375]$$

$$= 0.43$$

2 sig digs
in the
concentration
gives 2
decimals in
the pH

f) 3.66 g of NaOH dissolved in 400.0 mL of solution

$$3.66 \text{ g NaOH} \times \frac{1 \text{ mol}}{40.00 \text{ g}} = 0.09150 \text{ mol}$$

$$c = \frac{n}{V}$$

$$= \frac{0.0915 \text{ mol}}{0.4000 \text{ L}}$$

$$= 0.22875 \text{ M}$$

NaOH is a strong base, from Group I

$$\therefore [\text{OH}^{1-}] = [\text{NaOH}]$$

$$\text{pOH} = -\log [\text{OH}^{1-}]$$

$$= -\log [0.22875]$$

$$= 0.64064$$

$$\text{pH} = 14 - \text{pOH}$$

$$= 14 - 0.64064$$

$$= 13.359 \text{ (3 decimal places)}$$

g) 500.0 mL of 6.00 H₂SO₄ solution diluted to 3.00 L of solution

Calculate the concentration of the diluted acid using the dilution equation: $C_1V_1 = C_2V_2$

* both volumes must be in the same units, convert 500.0 mL to L by dividing by 1000

$$C_1V_1 = C_2V_2$$

$$0.5000 \text{ L} \times 6.00 \text{ M} = C_2 \times 3.00 \text{ L}$$

$$C_2 = \frac{0.5000 \text{ L} \times 6.00 \text{ M}}{3.00 \text{ L}}$$

$$= 1.000 \text{ M}$$

H₂SO₄ is a strong acid, therefore:

$$[\text{H}_3\text{O}^+] = [\text{H}_2\text{SO}_4] = C_2$$

$$\text{pH} = - \log [\text{H}_3\text{O}^{1+}]$$

$$= - \log [1.000]$$

$$= 0.000$$

3 sig digs
in the
concentration
gives 3
decimals in
the pH

h) 8.55 g of solid Mg(OH)₂ dissolved in 2.00 L of solution

$$8.55 \text{ g Mg(OH)}_2 \times \frac{1 \text{ mol}}{58.33 \text{ g}} = 0.1465798 \text{ mol}$$

$$c = \frac{n}{V}$$

$$= \frac{0.1465798 \text{ mol}}{2.00 \text{ L}}$$

$$= 0.07329 \text{ M}$$

Mg(OH)₂ is a strong base, from Group II

$$\therefore [\text{OH}^{1-}] = 2 \times [\text{Mg(OH)}_2]$$

$$= 0.14658 \text{ M}$$

$$\text{pOH} = - \log [\text{OH}^{1-}]$$

$$= - \log [0.14658]$$

$$= 0.83393$$

$$\text{pH} = 14 - \text{pOH}$$

$$= 14 - 0.83393$$

$$= 13.166$$

3 sig digs
in the
concentration
gives 3
decimals in
the pH

i) 2.50 g of CaO (s) dissolved in 500.0 mL of solution

$$2.50 \text{ g CaO} \times \frac{1 \text{ mol}}{56.08 \text{ g}} = 0.044579 \text{ mol}$$

$$c = \frac{n}{V}$$

$$= \frac{0.044579 \text{ mol}}{0.5000 \text{ L}}$$

$$= 0.089158 \text{ M}$$

CaO is a strong base, from Group II

$$\therefore [\text{OH}^{1-}] = 2 \times [\text{CaO}]$$

$$= 0.178317 \text{ M}$$

$$\text{pOH} = -\log [\text{OH}^{1-}]$$

$$= -\log [0.178317]$$

$$= 0.74881$$

$$\text{pH} = 14 - \text{pOH}$$

$$= 14 - 0.74881$$

$$= 13.251 \text{ (3 decimal places)}$$

3 sig digs
in the
concentration
gives 3
decimals in
the pH

2. In all of these examples, the pH of the acids is very low and the pH of the bases is very high. Suggest a reason why.

All of these substances are strong acids and bases and their concentrations are fairly high (above 0.10 M). They completely ionize/dissociate in water to produce high concentrations of H_3O^+ and OH^- ions, so the acids have very low pH and the bases have very high pH.

If, however, the concentration of HCl (a strong acid) was only 0.0000100 M, the pH would be only 4.000, showing that the pH of a solution depends on both the strength and concentration of the acid.

$$[\text{H}_3\text{O}^+] = [\text{HCl}]$$

$$\text{pH} = -\log [\text{H}_3\text{O}^{1+}]$$

$$= -\log [0.0000100]$$

$$= 4.000$$
